## Alice Slick Sheet Movement of Objects

For the purpose of this Slick Sheet we will define the Cartesian coordinate system<sup>1</sup> as follows:

The three dimensional Cartesian coordinate system provides the three physical dimensions of space — length, width, and height. The Figure below shows the method of representing length, width, and height used in this Slick Sheet. Another common way is to have the positive x-axis pointing toward the observer.

The three Cartesian axes defining the system are perpendicular to each other. The relevant coordinates are of the form (x, y, z). As an example, the figure shows two points plotted in a three-dimensional Cartesian coordinate system: P(3,0,5) and Q(-5,-5,7). The axes are depicted in a "world-coordinates" orientation with the *z*-axis pointing up.

| Q(-5, -5, 7) | ••••••••••••••••••                   | P(3, 0, 5)   | When directin<br>be in the x-z<br>direction. <sup>&</sup>lt;sup>1</sup> This definition was adapted from the Cartesian Coordinate System definition found at Wikipedia.com.

<sup>&</sup>lt;sup>2</sup> The object's axes of rotation may be and probably will be above the ground, and may or may not be at the object's center of mass. For example, a person object's axes of rotation point (0,0,0) is at its center of mass whereas an arm object's axes of rotation point (0,0,0) is at the shoulder joint.

<sup>&</sup>lt;sup>3</sup> When the *asSeenBy* argument is used for the *Move*, *Turn*, and *Roll* methods, the axes of rotation is set to the axes of rotation for the object that is referenced in the *asSeenBy* argument.
